

LAMINATE ON FOAM MAINTENANCE

Plastic Colors

As a general rule, most exterior letters will require some routine cleaning (every few months) to retain their original luster. Pigmented colors do contain UV stabilizers to slow down natural fading due to exposure the harmful UV rays. Painted colors also contain UV inhibitors and will also lose some original luster when exposed in exterior applications. This "fading" will vary based on color and installation location, as the hot desert sun will fade most colors faster than exposure in more northern climates.

Cleaning Plastic

Routine cleaning of plastics and painted plastics is best performed by using warm, soapy water and a soft cloth or sponge. Based on the local atmosphere, cleaning every few months is recommended. Locations such as industrial parks or inner city installations may require more frequent cleaning as the air quality will effect the cleanliness of the letters. Never clean Laminate letters with any harsh detergent or chemicals as this will dull (matte) the finish.

Repairing Paint Scratches

Scratches in letters can be a distraction, especially with interior installations. Smaller scratches can be minimized by first washing the letter, then applying car wax and buffing the scratch with a soft cloth. Faces with a grain direction should be rubbed in the direction of the grain. Polished letters can be buffed out with a light polishing buff. Deeper scratches in Metal Laminate may not be repairable.
